

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings of claims in the application:

LISTING OF CLAIMS:

1-9. (canceled)

10. (new) A network attack detection system, characterized in that a header of packet in transmission is examined and the values of one or more pre-specified fields in the packet header are observed, and in case the number of distinct values observed in the pre-specified fields reaches a pre-specified threshold within a pre-specified time interval, it is judged that an unauthorized attack is in progress, and this judgment is carried out based on either of the following conditions:

(a)  $N(t)$  is the number of distinct values of the field observed within a pre-specified time interval from time  $t$ ,  $N(t_1)$  is the number of distinct values of the field observed within the pre-specified time interval from some time  $t_1$  and if the ratio of  $N(t)$  to  $N(t_1)$  is greater than, or equal to, some pre-specified threshold  $k_1$ , that is, if  $N(t)/N(t_1) \geq k_1$ , the system will judge that an attack is in progress;

(b)  $P(t)$  is the number of packets in transmission within the pre-specified time interval from some time  $t$ , and if the ratio of the number of  $N(t)$  to  $P(t)$  is greater than, or equal

to, some pre-specified threshold  $k_2$ , that is,  $N(t)/P(t) \geq k_2$ , the system will judge that an attack is in progress;

(c)  $P(t_1)$  is the number of packets in transmission within the pre-specified time interval from some time  $t_1$ , and if the ratio of the coefficient computed in (b) above for the time  $t$  to that computed for the time  $t_1$ ,  $\{N(t)/P(t)\} / \{N(t_1)/P(t_1)\}$ , is greater than, or equal to, some pre-specified threshold  $k_3$ , that is,  $\{N(t)/P(t)\} / \{N(t_1)/P(t_1)\} \geq k_3$ , the system will judge that an attack is under progress;

(d)  $T(t)$  is the number of octets or bits in the packets in transmission within the pre-specified time interval from some time  $t$ , and if the ratio  $N(t)$  to  $T(t)$  is greater than, or equal to, some pre-specified threshold  $k_4$ , that is,  $N(t)/T(t) \geq k_4$ , the system will judge that an attack is in progress.

11. (new) The network attack detection system according to claim 10, characterized in that arbitrary combinations of two or more header fields are allowed, and the number of distinct values observed for the resultant composite field is used to compute the coefficient which is compared against the threshold.

12. (new) The network attack detection system according to claim 10, characterized in that it is inferred that an illegal attack is underway when the Time To Live (TTL) value in the

header field of a packet does not lie in the range of the values seen beforehand for the source address in the header of packets.

13. (new) A network attack detection system, characterized in that it is judged that an illegal attack has taken place by observing the values of the packet header fields, and when the number of distinct values seen in a combination of two or more header fields exceeds a pre-specified threshold value within a pre-specified time, it is judged that an attack is in progress.

14. (new) The network attack detection system according to claim 13, characterized in that judgment is made that an attack is in progress, if the Time to Live (TTL) value in the header of the packet does not lie in the range of the values seen beforehand for the source address in the header of the packet.

15. (new) The network attack tracking system according to claim 10, characterized in that a source of the unauthorized attack is searched by setting these systems at various places on the Internet.

16. (new) The network attack tracking system according to claim 11, characterized in that a source of the unauthorized

attack is searched by setting these systems at various places on the Internet.

17. (new) The network attack tracking system according to claim 12, characterized in that a source of the unauthorized attack is searched by setting these systems at various places on the Internet.

18. (new) The network attack tracking system according to claim 13, characterized in that a source of the unauthorized attack is searched by setting these systems at various places on the Internet.

19. (new) The network attack tracking system according to claim 14, characterized in that the source of the unauthorized attack is searched by setting these systems at various places on the Internet.

20. (new) A method of detecting a network attack, comprising the steps of:

examining a pre-specified field in a header of a packet in transmission for distinct values; and

determining that an unauthorized attack is in progress based on an observed number of distinct values in the examined

pre-specified header field reaching a pre-specified threshold within a pre-specified time interval, wherein,

the determination includes that at least one of the following conditions is satisfied

(a)  $N(t)$  is the number of the distinct values of the field observed within the pre-specified time interval from some time  $t$ ,  $N(t_1)$  is the number of distinct values of the field observed within the pre-specified time interval from some time  $t_1$  and the ratio of  $N(t)$  to  $N(t_1)$  is greater than, or equal to, a pre-specified threshold  $k_1$ , that is  $N(t)/N(t_1) \geq k_1$ ,

(b)  $P(t)$  is the number of packets in transmission within the pre-specified time interval from some time  $t$ , and the ratio of  $N(t)$  to  $P(t)$  is greater than, or equal to, some pre-specified threshold  $k_2$ , that is,  $N(t)/P(t) \geq k_2$ ,

(c)  $P(t_1)$  is the number of packets in transmission within the pre-specified time interval from the time  $t_1$ , and the ratio of the coefficient computed in (b) above for the time  $t$  to that computed for the time  $t_1$ ,  $\{N(t)/P(t)\} / \{N(t_1)/P(t_1)\}$ , is greater than, or equal to, some pre-specified threshold  $k_3$ , that is,  $\{N(t)/P(t)\} / \{N(t_1)/P(t_1)\} \geq k_3$ , and

(d)  $T(t)$  is the number of octets or bits in the packets in transmission within the pre-specified time interval from some time  $t$ , and the ratio  $N(t)$  to  $T(t)$  is greater than, or equal to, some pre-specified threshold  $k_4$ , that is,  $N(t)/T(t) \geq k_4$ .

21. (new) The method of claim 20, wherein,  
said examining step examines a resultant composite  
field comprised of arbitrary combinations of two or more of  
header fields, and

the number of distinct values observed for the  
resultant composite field is used to compute the coefficient  
which is compared against the threshold.

22. (new) The method of claim 20, comprising the  
further steps of:

from an examined packet, inferring that the  
unauthorized attack is underway when a Time To Live (TTL) value  
in the pre-specified field of the examined packet is outside a  
range of the values seen beforehand for the source address in the  
header of the examined packet, and

after determining that the source address in the header  
of the examined packet is legitimate, detecting the unauthorized  
attack based on whether the Time To Live value is within a pre-  
specified range of the expected Time To Live value for the source  
address.

23. (new) The method of claim 20, wherein,  
said examining step is performed at various places on  
the Internet.

24. (new) A method of detecting a network attack, comprising the step of:

observing values of packet header fields and upon observing that a number of distinct values seen in a combination of two or more header fields exceeds a pre-specified threshold value within a pre-specified time, judging that an unauthorized attack is in progress.

25. (new) The method of claim 24, wherein, observing a Time To Live value in the packet header and judging the unauthorized attack is in progress upon the observed Time To Live value being outside a range of the values seen beforehand for the source address in the packet header.

26. (new) The method of claim 24, wherein, said observing step is performed at various places on the Internet.
